1. Introduction

This project presents a comprehensive Banking Management System designed to efficiently manage customer accounts, employee records, loan processing, and financial transactions. The system implements core data structures including **arrays** for fixed-size collections, **doubly linked lists** for dynamic loan management, and **singly linked lists** for archived data storage.

Key algorithms implemented include **linear search** for customer/employee lookup, **sorting algorithms** for data organization, and **traversal operations** for linked list manipulation. The application utilizes **C++** as the primary programming language, **Qt Designer** for professional GUI design, and **CMake** as the build system.

The system achieves a fully functional GUI-based banking solution with **CSV file persistence**, supporting operations for three user roles (customers, employees, managers) with over 25 interconnected windows and real-time data validation.

Project Scope

Customer Operations

- Account registration
- Deposit/Withdrawal
- Loan requests
- Transaction history

Employee Operations

- Add customers
- Manage accounts

- Process loans
- Daily operations

Manager Operations

- Hire/Fire employees
- View statistics
- Access archives
- Generate reports

Teamwork & Collaboration

An essential aspect of this project was the strong teamwork maintained throughout its development.

Our group strategically split into two teams working simultaneously on different components of the system: one team focused on data structure implementation and backend logic, while the other worked on the Qt GUI design and user interaction flow.

Although coordinating parallel development introduced challenges—such as merging features, aligning coding styles, and resolving unexpected integration issues—we consistently communicated, reviewed each other's work, and adapted when necessary.

These collaborative efforts allowed us to overcome obstacles efficiently and ultimately deliver a unified, fully functional banking management system.

This experience strengthened our technical abilities as well as our capacity to work as an effective software development team.

2. Problem Statement

2.1 Challenges in Manual Banking Management

1. **Error-Prone Manual Processing:** Manual record-keeping leads to human errors in calculations, data entry, and record retrieval, potentially causing financial discrepancies.
2. **Inefficient Data Retrieval:** Searching through physical records or poorly organized digital files wastes time and reduces productivity.
3. **Limited Scalability:** As customer base grows, manual systems become increasingly difficult to manage without proper data structure implementation.
4. **Data Integrity Issues:** Without proper validation and concurrent access control, data corruption and inconsistencies arise.

2.2 Project Solution

This system addresses these challenges through strategic data structure selection and algorithm implementation:

Data Structure Selection

Arrays: Fixed capacity (100 customers/employees) provides $O(1)$ access time with predictable memory usage, suitable for controlled-scale applications.

Linked Lists: Dynamic loan storage allows unlimited loan history per customer with efficient insertion/deletion operations.

3. Methodology

3.1 Data Structures Implementation

3.1.1 Static Arrays

Structure: `customer cust[100] , employee employees[100]`

Complexity: $O(1)$ access, $O(n)$ search, $O(n)$ insertion/deletion

Justification: Predictable memory allocation, cache-friendly access patterns

3.1.2 Doubly Linked List (Loans)

Structure: `struct Node { loan data; Node* next; Node* previous; }`

Complexity: $O(1)$ insertion at ends, $O(n)$ search, $O(1)$ deletion with pointer

Justification: Supports unlimited loans per customer, enables bidirectional traversal

3.2 Algorithms Applied

Search Algorithms

- **Linear Search:** Customer lookup by account number $O(n)$
- **Sequential Scan:** Employee ID verification

Sorting Algorithms

- **Bubble Sort:** Employee sorting by name/branch
- **Date Comparison:** Sorting by hire date

6. System Screenshots & Results

Figure 0: Main Banking System interface

6.1 User Registration & Authentication

The image displays a customer registration interface on a dark blue background. On the left, a 'Register' dialog box contains a multi-field form for personal information entry, with fields for first name, last name, email, phone number, and address. Below the fields are 'Create' and 'Back' buttons. On the right, an 'Initialize the customer Account' dialog box contains fields for 'Account Holder Name', 'Bank Branch' (with a dropdown menu showing 'Tunis'), and 'Account Type' (with a dropdown menu). Below these fields are 'Cancel' and 'Finish' buttons.

Figure 1: Customer registration interface showing multi-field form for personal information entry with validation.

The image displays an account initialization dialog box on a dark blue background. The dialog is titled 'Initialize Your Account'. It contains three input fields: 'Account Holder Name', 'Bank Branch' (with a dropdown menu showing 'Tunis'), and 'Account Type' (with a dropdown menu). Below the fields are 'Back' and 'Finish' buttons.

Figure 2: Account initialization dialog with bank branch and account type selection, featuring auto-generated IBAN.

The image shows a dark blue login interface with a white-bordered box in the center. The box is titled "Login" and "SIGN-IN". It contains two input fields: "UserName" and "Password". Below the input fields are three buttons: "Back", "Login", and "Exit". To the right of the box is a large white outline of a person. In the bottom left corner, the text "Manager Menu" is visible.

Figure 3: Unified login interface (SIGN-IN) for customer, employee, and manager authentication using linear search algorithm.

The image shows a dark blue interface with a white-bordered box in the center. The box is titled "Request For A Loan". It contains several input fields: "amount", "start date" (with a date picker showing 7/12/2025), "end date" (with a date picker showing 7/12/2026), "interest rate", and "loan type" (a dropdown menu showing "Personal Loan"). Below the input fields are three buttons: "Back", "Finish", and "Exit".

Figure 4: A loan Request interface

6.2 Customer Portal

Figure 5: Customer dashboard displaying available banking operations: Deposit, Withdraw, Show Loans, Show Daily Transaction.

Figure 6: Deposit transaction interface with amount input, current balance display, and real-time balance updates.

The image shows a web interface titled "Loan List" on a dark blue background. At the top, there is a search bar with the label "Account Number", a white input field, and a "Show" button. Below this is a table with the following headers: "Loan Number", "Loan ID", "Loan Type", "Principle Amount", "Interest Rate", "Remaining", and "Mo". The table body is currently empty. At the bottom of the interface, there are two buttons: "Back" on the left and "Exit" on the right.

Figure 7: Loan display using doubly linked list traversal, showing Loan Number, ID, Type, Principal, Interest Rate, and Monthly Payment.

The image shows a web interface titled "Withdraw" on a dark blue background. In the center, there is a white-bordered box containing the following elements: a label "Account Number", a label "Enter Amount :" followed by a white input field, and a label "Your Balance :". Below the input field, there are three buttons: "Back", "Withdraw", and "Exit".

Figure 8: Withdraw Money and display remaining balance.

6.3 Transaction Management

Figure 7: Daily transaction history with tabbed interface (Accounts/Loans/Transactions) displaying chronological transaction records.

Figure 9: Undo last transaction feature with confirmation dialog, implementing LIFO stack operation for transaction reversal.

6.4 Employee Operations

6.5 Manager Operations

The screenshot displays a dark-themed user interface for adding a new employee. The form is titled "Add Employee" and is enclosed in a light blue border. It features the following fields and controls:

- ID:** A text input field.
- Name:** A text input field.
- Last Name:** A text input field.
- Address:** A text input field.
- Salary:** A text input field.
- Bank Branch:** A dropdown menu with "Tunis" selected and a downward arrow icon.
- Username:** A text input field.
- Password:** A text input field.
- Buttons:** Three buttons at the bottom: "Back", "Add", and "Exit".

6.6 Key Features Demonstrated

Data Structure Usage

- **Arrays:** Customer/Employee storage ($O(1)$ access)
- **Doubly Linked Lists:** Loan history (bidirectional traversal)
- **Transaction Arrays:** Financial history tracking

Algorithm Implementation

- **Linear Search:** Login authentication, account lookup
- **Bubble Sort:** Employee sorting by multiple fields
- **Linked List Traversal:** Loan display and statistics

7. Challenges & Solutions

Challenge 1: Nested Data Structure Complexity

Problem: Managing customer → account → loans (linked list) + transactions (array) created type confusion and pointer errors.

Solution: Clearly defined separate header files for each structure level with consistent naming conventions and helper functions.

Challenge 2: Qt Integration & MOC Compilation

Problem: Meta-Object Compiler (MOC) errors when Qt classes weren't properly declared.

Solution: Ensured all Qt classes include `Q_OBJECT` macro and properly configured `CMakeLists.txt` with `CMAKE_AUTOMOC`.

Challenge 3: CSV Data Corruption During Updates

Problem: Direct file modification could corrupt data if program crashed mid-write.

Solution: Implemented atomic file replacement strategy: write to temporary file → close both → delete original → rename temp.

Challenge 4: Memory Leaks in Linked Lists

Problem: Deleting customers/employees without properly freeing their loan linked lists caused memory leaks.

Solution: Implemented `destroyList()` function to recursively delete all nodes with proper cleanup in destructors.

8. Conclusion

8.1 Project Achievements

- **Complete Functional Implementation:** All planned features successfully implemented and tested
- **Effective Data Structure Usage:** Strategic deployment of arrays and linked lists for optimal performance
- **Professional GUI Development:** Intuitive interface comparable to commercial banking applications
- **Robust Data Persistence:** CSV-based storage with atomic update mechanisms ensuring data integrity
- **Multi-Role Access Control:** Successfully implemented three distinct user roles with appropriate permissions

8.2 Learning Outcomes

Technical Skills Acquired

- Deep understanding of static arrays vs. dynamic structures trade-offs
- Practical experience with doubly and singly linked list implementations
- Proficiency in Qt framework for cross-platform GUI development
- File I/O operations and data serialization techniques
- Algorithm complexity analysis (Big-O notation) in real contexts
- Memory management and pointer manipulation in C++

8.3 Future Improvements

Short-term Enhancements

- Implement binary search trees for $O(\log n)$ lookups
- Add hash tables for $O(1)$ average-case searches
- Integrate SQLite database for better persistence
- Implement password hashing (SHA-256)
- Add data export to Excel/PDF formats

Long-term Vision

- Client-server architecture with Qt networking
- PostgreSQL/MySQL integration for enterprise scale
- Advanced analytics with chart libraries
- Email notifications for loan approvals
- Mobile application companion (Qt for Android/iOS)
- RESTful API for third-party integration

8.4 Final Remarks

The development of this Banking Management System provided invaluable hands-on experience in applying theoretical computer science concepts to practical software development. The challenges encountered—from Qt integration issues to CSV data corruption handling—taught us resilience and systematic debugging approaches.

Most importantly, this project demonstrated that choosing the right data structure is as crucial as writing correct code. The decision to use arrays for primary storage traded scalability for simplicity and performance, while linked lists enabled flexible loan management without predefined size limits.

Key Takeaway: Data Structures and Algorithms are not merely academic concepts but fundamental tools that directly impact software performance, maintainability, and user experience.
